Nematodes
Nematodes – General Characters

- Non-segmented cylindrical worms tapering at both ends
- Possess cuticle
- Sexes are separate (dioecious), male is smaller than female & its posterior end is curved ventrally
- Females are either
  - Viviparous (produce larvae/embryos)
  - Oviparous (lay eggs) or
  - Ovo-viviparous (lay eggs which hatch immediately)
- Live in intestinal tract or tissues

Modes of Infection of Nematodes

1. **Ingestion** of –
   - Embryonated eggs contaminating food & drinks, e.g. *A.lumbricoides, E. vermicularis* & *T. trichiura*
   - Growing embryos in an intermediate host (infected cyclops) e.g. *D.medinensis*
   - Encysted embryos in infected pig’s flesh e.g. *Trichinella spiralis*

2. **Penetration of skin** – filariform larvae bores through the skin e.g. *A.duodenale, S.stercoralis, N.americanus*

3. By **blood sucking insects** e.g. filarial worms

4. **Inhalation of infected dust** containing embryonated eggs e.g. *A.lumbricoides, E.vermicularis*

The Life Cycle Of ROUNDWORMS
Ascaris Lumbricoides and Ascaris Suum

Adult males and females are in the small intestine.

Females produce eggs that are passed in the host’s feces. (A single female can produce 200,000 eggs per day.)

Juveniles in eggs mature to the infective (second) stage.

Eggs ingested by host and hatch in the small intestine. The juveniles penetrate the tissues of the intestine and enter the blood stream.

The juveniles are "coughed up" and swallowed. The juveniles complete their development in the small intestine.

The third stage juveniles migrate from the pulmonary capillaries into the alveoli (air sacs).

The juveniles migrate to the lungs and molt into third stage juveniles.

(Parasites and Parasitological Resources)
Life cycle

Adult worms (intestine)

Unembryonated eggs (stool)

Embryonated eggs in 2-3 weeks in soil (infective form)

Ingestion of eggs

Rhabditiform larva hatches

Penetrate intestine, reach liver

Right heart, lung, respiratory passage,

Throat, swallow, small intestine
Pathogenicity & Clinical Features

- **Ascariasis** – infection of *A. lumbricoides*
- Majority of infections are asymptomatic
- Clinical disease is largely restricted to individuals with a high worm load
- Symptoms divided into two groups: those produced by
  1. Migrating larvae
  2. Adult worms
Symptoms & Complications

- **Symptoms produced by Migrating larvae**
  1. **Pneumonia (loeffler’s syndrome)** – fever, cough, dyspnoea, blood tinged sputum that may contain larva, urticarial rash & eosinophilia
  2. **Visceral larva migrans** – if larvae enter systemic circulation (from pulmonary capillaries) to reach other organs like brain, spinal cord, heart, kidney.
Symptoms & Complications

- **Symptoms produced by Adult worms**
  1. *Abdominal discomfort*, anorexia, nausea & *diarrhoea*.
  2. *PEM, Vit. A deficiency* (night blindness)
  3. Intestinal *obstruction* (particularly in children 1-5 years), *intussusception* & *volvulus*
  4. *Penetration* through intestinal ulcer (*perforation*) – *peritonitis*
  5. *Hypersensitivity reactions* to worm Ags (toxic body fluids) – urticaria, edema of face, conjunctivitis, irritation of URT
Symptoms produced by Adult worms

6. **Ectopic Ascariasis** – due to migration of worm up into the stomach. It may
   - be vomited out,
   - pass up through the oesophagus at night & comes out through mouth or nose,
   - enter larynx to cause asphyxia.
   - migrate to other organs and cause appendicitis, cholecystitis, biliary colic, cholangitis, pancreatitis
Laboratory Diagnosis

- **Macroscopic** - Direct detection of worm/s in stool or vomit

- **Microscopic** – direct examination of feces following floatation method: **bile stained eggs**. (Eggs may not be seen at least 40 days after infection)

- **Blood examination** – **eosinophilia**.
Other modes of diagnosis

- Imaging – large collections of worms in abdomen
- USG - to diagnose hepatobiliary or pancreatic ascariasis
- Serology (Ab detection) – mainly reserved for epidemiological studies.
Treatment

- **Mebendazole/ Albendazole** – drug of choice but contraindicated in pregnancy & heavy infection

- **Pyrantel pamoate** – single dose

- **Piperazine citrate** - suspected intestinal or biliary obstruction since this drug paralyzes worms to aid expulsion.

- **Levamisole**
Prevention

- Good sanitation and personal hygiene

- Mass treatments with single dose mebendazole or albendazole for all school-age children every three to four months - serves dual function:
  - treats the children and
  - reduces the overall worm burden in the community

Sites of skin penetration

- Most common sites are:
  1. Thin skin between toes
  2. Dorsum of the feet
  3. Inner side of the soles

- Gardeners & miners – skin of hands
Life cycle of hookworm

- Eggs in feces
- Filariform larvae
- 6 to 8 days
- 8 to 10 days
- Rhabditiform larvae hatch
- Swallowed
- Attached to small intestine
- Trachea
- Lungs
- Circulation
- Penetrates skin
- Humans
- 6 to 8 weeks
- 48 hours

Dr Ekta, Microbiology
Hook worms in the intestine
Pathogenicity & Clinical Features

- **Ancylostomiasis** or hookworm disease, characterised by **iron deficiency anaemia**
- Majority of infections are asymptomatic
- Symptoms develop in heavy infections and divided into two groups: those produced by
  1. Migrating larvae
  2. Adult worms
Symptoms produced by larvae

- **Lesions in the skin:**
  1. **Ancylostome dermatitis or Ground itch** – occurs at the site of entry (more common in *necator*), lasts for 2 to 4 weeks.
  2. **Creeping eruption** – reddish itchy papule along the path traversed by filariform larvae (**larva migrans**).

- **Lesions in the lungs** – bronchitis & bronchopneumonia.
Symptoms produced by adult worm

- Epigastric pain, diarrhoea & vomiting during early phase of infection.

- Microcytic hypochromic (Iron deficiency) anaemia – due to chronic blood loss:
  - a single adult hookworm sucks 0.2ml of blood/ day
  - Hemorrhages from punctured sites
Clinical features of hookworm anemia

- Extreme pallor
- Abnormal appetite showing **Pica** or **Geophagy** – perverted taste for earth, mud or lime
- **Epigastric tenderness** with dyspepsia
- Constipation
- **Puffy face** with swelling of lower eyelids
- **Pedal edema**
- **Growth retardation**
- **General appearance** – pale plumpy with protuberant abdomen & dry lustreless hair.

20/04/08 Dr Ekta, Microbiology
Laboratory Diagnosis

- **Stool examination** – microscopy: non bile stained egg, segmented

- **Occult blood in stool** – positive

- **Blood examination** – anaemia, eosinophilia
Treatment

- Mebendazole / Albendazole
- Pyrantel pamoate
- Oral iron replacement – ferrous sulphate 400mg tid
- Nutritional support

* If Hb is below 30%, then anemia should be treated first with Iron till Hb comes over 50%.
Prevention & Control

- Proper sanitation measures & sewage disposal
- Personal hygiene
- Personal protection – wearing boots & gloves
- Simultaneous treatment of carriers & diseased with wholesale treatment of community

20/04/08    Dr Ekta, Microbiology

</tr>
<tr>
<td>Wall of Small intestine, mainly duodenum &amp; jejunum</td>
</tr>
</tbody>
</table>
Life cycle – S. stercoralis

- Adults in intestine
- Eggs in intestine
- Rhabditiform larvae hatch
- Autoinfection
- Larvae in feces - soil
- Direct: Larvae into adults
- Indirect: Eggs produced
- Larvae penetrate intestine
- Filariform larvae (infective form)
- Larvae pass through similar to Ascaris
- Larvae in blood
- Penetrate skin
Pathogenicity

1. **Skin lesions (2 types) – “larva currens”**
   - At the site of entry – urticarial rash
   - In the perianal region – linear, erythematous urticarial wheal

2. **Pulmonary lesions – due to migrating larva**
   - Alveolar hemorrhages
   - Bronchopneumonia

3. **Intestinal lesions - “burrowing lesions”**
   - Epigastric pain
   - Diarrhoea with blood & mucus
   - Nausea
   - Weight loss
Important terms to know

- **Autoinfection – filariform larva**
  1. In the Intestinal lumen
  2. Perineal & perianal skin penetration

- **Hyperinfection – can result in autoinfection**
  1. Steroids or Immunosuppressive therapy
  2. Malignancy
  3. Malnutrition
  4. Pregnancy
  5. Puerperium
  6. AIDS

- **Persistence of infection – due to autoinfection**
Laboratory Diagnosis

- **Stool examination** – rhabditiform larva
- **Culture** – larva
- **ELISA** – to detect Abs
Potentially life threatening disease – treat even if its asymptomatic

Thiabendazole for 2 days

Disseminated strongyloidosis – 5 to 7 days.
<table>
<thead>
<tr>
<th><strong>Trichinella spiralis</strong> <em>(Trichina Worm)</em></th>
</tr>
</thead>
</table>
| **Adult worms** *(smallest nematode infecting man)* | **Male 1.4 – 1.6 mm**  
**Female 3 - 4 mm, viviparous** |
| **Inf ective form** | **Encysted larvae (100μ) in striated muscles of pig** |
| **Mode of transmission** | **Ingestion of improperly cooked pork** |
| **Site of localization** | **Small intestine** |
| **Commonly involved muscles** | **Diaphragm, Intercostals, Deltoid, Pectoralis major, Biceps** |

20/04/08 Dr Ekta, Microbiology
Life Cycle – *T. spiralis*

- Encysted larva in pig muscles (infective form)
- Larva deposit and encyst in striated muscles
- Larva enters circulation
- Female deposits larva in intestinal mucosa
- Eating undercooked pork
  - Larva released in small intestine
  - Develop into adult worms

40 hrs
Pathogenicity

- **Trichinelliasis / Trichinosis** – clinical features depends on the stage:

  1. **Stage of intestinal invasion**: 5-7 days, pain in abdomen, nausea, vomiting, diarrhoea
  2. **Stage of larval migration**: fever, urticarial rash, splinter hemorrhages, periorbital & facial edema
  3. **Stage of encystation**: asymptomatic in light infections; myalgia, weakness in heavy infections

- **Complications – during migration**:
  - myocarditis, encephalitis

20/04/08 Dr Ekta, Microbiology
Laboratory Diagnosis

- **Muscle biopsy** – encysted larva
- **Blood** – eosinophilia between 2nd & 4th week
- **Serology** – to detect specific Abs by:
  1. Bentonite flocculation test
  2. Latex agglutination test
**Treatment**

- Thiabendazole & Mebendazole – adult worms
- Corticosteroids – complications

**Prevention**

- Proper cooking of pork or proper storage
- Avoidance of feeding bits & refuse from slaughter houses & farms to pigs – breaks life cycle.
Enterobius vermicularis

(Pin Worm, Seatworm)

Adult worms
Male 2 - 5 mm
Female 8 -13 mm, oviparous

Eggs
60 µ, non bile stained
Plano-convex with coiled embryo

Infectedive form
Embryonated egg

Mode of transmission
Ingestion, Autoinfection

Site of localization
Large intestine – caecum & appendix

20/04/08 Dr Ekta, Microbiology
Life cycle – *E. vermicularis*

1. Eggs on perianal folds. Larvae inside the eggs mature within 4 to 6 hours.
2. Embryonated eggs ingested by human.
3. Larvae hatch in small intestine.
4. Adults in lumen of cecum.
5. Gravid female migrates to perianal region at night to lay eggs.
Clinical features

- Due to migration of worm - **Perianal, perineal & vaginal itching (pruritis)** worsens at night.

- Insomnia and restlessness

- Nocturnal enuresis
Laboratory Diagnosis & Treatment

- Detection of adult worms in:
  - Feces
  - Perianal region

- NIH swab – scrapings from perianal region

- Microscopy – non bile stained eggs

- Mebendazole, pyrantel pamoate
<table>

20/04/08  Dr Ekta, Microbiology
Life cycle

1. Unembryonated eggs passed in feces.
2. 2-cell stage
3. Advanced cleavage
4. Embryonated eggs are ingested.
5. Larvae hatch in small intestine
6. Adults in cecum

⚠️ Infective Stage
⚠️ Diagnostic Stage

20/04/08
Dr Ekta, Microbiology
Clinical features

Infection – **Trichuriasis**

Symptoms depend on worm burden

- Less than 10 worms – asymptomatic

- Heavier infections –
  1. chronic **profuse mucus and bloody diarrhea** with **abdominal pains** and edematous rectum
  2. malnutrition, **weight loss** and anemia
Laboratory diagnosis & Treatment

- **Stool examination** – bile stained eggs with bipolar mucus plugs

- **Treatment** – albendazole / mebendazole

- **Prevention** –
  - Proper disposal of night soil
  - Prevention of consumption of uncooked vegetables & fruits.
Key to the diagnosis of Intestinal Nematodes

Intestinal Nematodes

- Larvae in Stool
  - S. stercoralis

- Eggs in stool
  - Colored (Bile Stained)
    - A. lumbricoides
    - T. trichiura
  - Colorless (Non Bile Stained)
    - A. duodenale
    - N. americanus
    - E. vermicularis

- Eggs on Perianal Skin
  - Colorless (Non Bile Stained)
    - E. vermicularis
