

Pediatric Tuberculosis

Tuberculin Skin Test

- PPD TU -1/2/5
- RT23 and Tween 80
- Wheal of about 6 mm
- Read at 48-72 hours
- Ballpoint or palpatory methods

Reading of Tuberculin Test

- Positive
- Strongly Positive
- Negative
- False Negative

Grading of Positive Test

Induration (mm)	Grade	Reaction
10 to 14	1+	Mild
15 to 20	2+	Moderate
21 to 30	3+	Severe
> 30	4+	Very Severe

What if child returns beyond 72 hours

- By 7th day, a positive test can still be read.
- A repeat test may be needed, if there is no induration.
- .
- Repeat tuberculin test when required should preferably be done on the other arm.
- The reading of the same should be interpreted as in any other individual.

BCG Test

- Read on 3rd day (24 hrs to 10 days)

Negative:

- Papule with induration-2 weeks
- Pustule-4 to 6 weeks
- Healing with scab formation 7- to 10 weeks

BCG Test cont...

- Positive (accelerated reaction)
- 24-72 hours induration:
 - 5-9 mm: Mild (1+)
 - 10-20 mm: Moderate (2+)
 - 21-30 mm: Severe (3+)
- 5-8 days: Pustule formation
- 10-15 days: Healing with scab formation

Interpretation of BCG Test

Malnourished

- Induration of 5 mm or more in within 48-72 hours or accelerated reaction
- False positive: BCG in last 6 months
- Vaccinated : 2-3 +
- Unvaccinated: 1+

Investigations cont...

- CXR
- USG Chest
- CT chest
- BAL
- Bacteriological Diagnosis
- Histopathological Diagnosis
- DNA studies
- Serodiagnosis

IGRA's

- Measure the production of interferon gamma by the peripheral mononuclear cells
- These use two antigens, early secretion antigen target (ESAT 6) and culture filtrate protein 10 (CFP 10).
- Principle similar to skin test but do away with the need for a repeat visit by the patient for reading purposes)
- Quantiferon Gold and T spot are two of the commercially available IGRAs.
- Used in place of the skin test in low prevalence countries to detect latent TB infection.

IAP Guidelines 2010

When to suspect TB?

Fever

and / or

Cough > 2 weeks

with

Loss of weight

and

Recent contact with infectious case

What to do next?

- Chest X-ray and A/B
- In case of clinical and radiological non-response,
 - Mantoux test
and
Sputum or GA for AFB
- AFB is positive, diagnosis is confirmed.

Don'ts

- BCG, ELISA & PCR tests recommended.
- There is no place for trial of anti-tubercular therapy
- Routine LFTs

Do's

- Try to isolate AFB whenever possible.
- DOTS
- Rpt CXR at end of therapy.

TB Contact

- Within 2 years
- Sputum positive

- Recent wt loss

vs

- Not growing well/ not gaining weight

Risk Factors

- Recent history of measles or whooping cough.
- Immuno-compromised state including steroid therapy.

1. Fever and/or cough for more than 2 weeks
2. Loss of weight or failure to thrive
3. Recent contact with an infectious case

Chest X-ray

Pulmonary lesion seen

Broad spectrum antibiotics for 7-10 days

May skip this step if: (a) Miliary shadows seen or (b) the child has already taken adequate antibiotics, but is still symptomatic

Clinical and radiological non-response

Sputum / gastric aspirate for AFB, Mantoux test

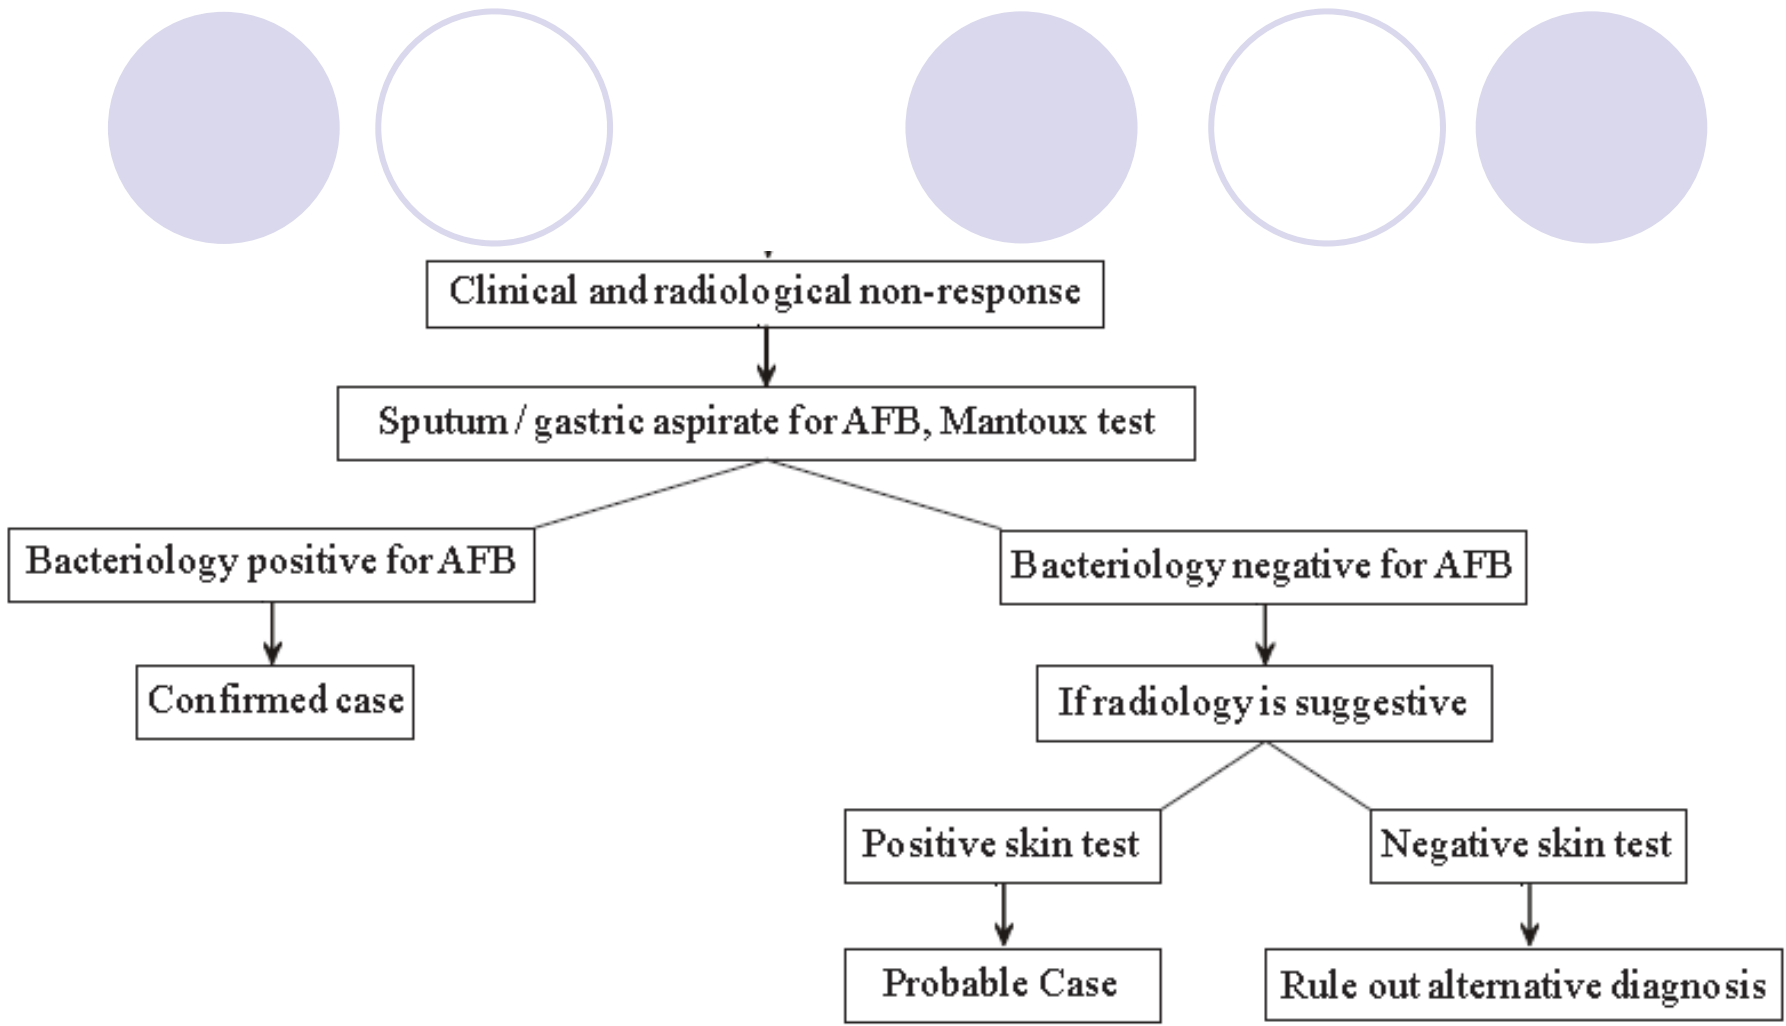

TABLE I DEFINITIONS FOR CATEGORIZING FOR TREATMENT OF PEDIATRIC TUBERCULOSIS

A. Case definitions for site

Pulmonary: Refers to disease involving lung parenchyma. **Extra Pulmonary:** Refers to disease involving sites other than lung parenchyma Both pulmonary and Extra pulmonary constitutes Pulmonary Extra- Pulmonary involving several sites is defined by most severe site.

B. Case definitions for severity

Pulmonary TB

Severe Pulmonary TB

All other except PPC e.g.

- o Progressive primary disease
- o Fibro-cavitatory disease
- o Miliary

Less severe Pulmonary TB

- Primary Pulmonary complex (PPC)

Case Definitions

- **New Case:** A patient who has had no previous ATT or had it for less than 4 weeks.
- **Relapse:** Patient declared cured/completed therapy in past and has evidence of recurrence.
- **Treatment Failure:** Patient who fails to respond/deteriorates after 12 weeks of compliant intensive phase.
- **Treatment after default:** A patient who has taken treatment for at least 4 weeks and comes after interruption of treatment for 2 months and has active disease

Thanks
